Column experiment

The imaginary laboratory records three samples without using personal records. Each sample has a readable description and a value in its original written form. The identifier 0012 names a series, while −7 records a signed change. The decimal point in 123.45 remains part of the observation. A revision can correct a transcription only while retaining the original document and a reason for the change.

$$E = mc^2$$

$$\frac{x_i + 1}{2}$$

Code	Value	Note
0012	0	
B	−7	123.45

Measured cells

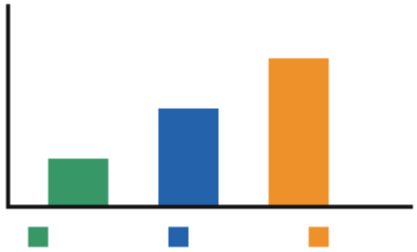

Figure 1 — Three regions and laboratory axes.

Distinct first page value 51.08.

Note: the signed temperature is −3.

Final observations

The second observation separates content from its position on the page. A sentence can occupy two lines without changing its words, but a missing line changes the result. Empty cells are present in the table and do not ask the reader to invent a measurement. The figure contains colored regions, axes and a legend. A matching filename cannot establish that those elements survived conversion.

$$\sum_{i=1}^{n} x_i$$

$$a = 1$$
$$b = -2$$

$$\begin{bmatrix} 0 & -1 \\ 2 & 3 \end{bmatrix}$$

Distinct final value 92.06; no page may be omitted.
